OBESITY: PREVENTION AND MANAGEMENT

THE BLUE CROSS

Britain's pet charity

Obesity in horses and ponies is a growing welfare problem and many are being allowed to become overweight to the point where they are susceptible to painful medical problems such as laminitis. Ponies in particular have evolved to survive on a fibre-based diet on rough plains and usually do not need the volume of feed we offer.

Perfect weight and condition

No two horses are exactly alike in shape, size and type. Their breeding, history and recent general management all influence their body condition, no matter how easily or not they tend to gain weight. The perfect weight is best gauged by considering the horse's overall fitness and body condition.

All horses and ponies should be managed with a combination of the appropriate type and quantity of feed, good general health management and regular, suitable exercise (even if they are not in ridden work). This is particularly important for those horses and ponies that are "good doers", that is those that put on weight rapidly regardless of how meagre the grazing or feed ration appears to be.

Assessing weight and condition

It is a good idea to use a weigh-tape weekly (measured around the horse's girth, where a roller or surcingle would normally fit). Record the weight so that the diet can be adjusted accordingly. While weigh-tapes are not always accurate at assessing the exact weight, and may differ between brands, if the same tape is used each time then any weight loss or gain will be comparable with previous records. After all, it is the changes in weight gain and weight loss that are important, combined with the horse's physical health, well-being and body condition.

It is essential a horse's physical body condition be monitored weekly. Check the animal's crest and, if it is large and hard, there is a problem and the diet needs to be looked at immediately. Also, take the horse off the grass until it softens. Check the loins as they should be no more than level across the spine. If looked at from behind, the horse should be rounded but should not have a dip or "W" shape across the pelvis; the ribs should be easily felt.

A condition score can be given to different places on the horse's body to help monitor weight. These are usually the pelvis, loins, ribs and neck. Scores run on a scale from one to five. One is "emaciated", three is in "good condition" and five is "obese". Half points can be used to help with accuracy.

Gradual weight loss programme

Excess body condition is unnecessary and undesirable, raising concerns for the long-term health and well-being of the individual, particularly if the animal is subject to excessive fluctuations in weight or remains in a fat condition long term. It can take several months to return to a normal weight and good body condition. Fat deposits laid down for some time, and those which are hard to the touch are the most difficult to shift.

Weight gain is often exacerbated in “resting” horses (companions, retired or otherwise out of work) as a result of the lack of appropriate exercise (which is not adequately provided by free-ranging on good pasture) combined with an ad hoc intake of forage required for maintenance. Also, remember that seasonal changes in pasture conditions can occur ahead of a change in management practices.

All weight loss programmes should be undertaken in conjunction with veterinary advice and be appropriate to an individual horse. Any possible underlying conditions for unexplained weight gain should be considered and ruled out before commencing a programme. Horses suffering from laminitis should be treated and managed under veterinary supervision.

Managing nutritional intake

Weight gain occurs if a horse's nutritional intake is greater than the physical energy demand. Therefore, in order to lose weight, the nutritional intake must reduce and/or the physical energy demands increase. A balanced approach to exercise and diet is essential.

Veterinary advice should be sought to rule out any health factors that could be causing or contributing to a weight gain problem, and to seek advice on a suitable weight management programme.

Weight loss must be gradual as serious health risks can arise from weight loss that is incorrectly managed. A horse must never be put onto a starvation diet, but the diet must be amended and balanced with increased physical activity.

Ideally, horses should be fed one to one and a half, per cent of their normal healthy (target) body weight during the weight loss period. This is slightly below the normal maintenance level of approximately two to two and a half per cent of desired body weight.

The horse should be restricted to a corral area where it has freedom of movement and ready access to fresh water and shelter. The ration should be high-fibre based, of clean, moderate nutritional value hay, which may be combined with a proportion of feed-quality straw to bulk it out.

This ration should be sub divided into frequent small feeds and offered in several piles to encourage the horse to move around, emulating foraging. Small mess hay nets increase consumption time and may be hung at a low level to allow a more natural "grazing" head carriage. Salt or mineral blocks should be available, but preferably not molassed varieties.

Where appropriate, to ensure the individual's mental well-being, a horse may be permitted a limited daily period of access to sparse pasture, or normal pasture with a grazing muzzle. These must be fitted correctly and worn only for a limited period – a high degree of supervision is recommended.

As part of the ration calculation, any time spent grazing must be considered as part of the nutritional intake and the "fed" ration amended accordingly. However, this can be difficult to determine accurately and may have an impact on the effectiveness of the weight loss programme.

Exercise and increasing physical activity

Appropriate exercise is essential for all horses, but levels of activity must increase gradually without stressing an unfit horse. For a sound and otherwise healthy horse, exercise is one of the best means of assisting weight loss and improving physical health and fitness. If the horse is physically capable of working, then regular exercise should form an active part of the weight loss programme.

A horse can be exercised in-hand, ridden or loose. Exercising a horse daily in two shorter sessions rather than one long session helps increase the benefits without straining the animal, and also maintains interest and variety throughout the day. As a horse's recovery time following activity improves, so can the intensity and duration of exercise in the subsequent sessions.

Additionally, time spent grooming a horse can be both mentally and physically stimulating for the animal, promoting good general well-being. Equine companionship and interaction is also important.

Preventing future weight gain

Once a horse has returned to a good, healthy condition, it is essential to take measures to ensure that the desired weight and condition are maintained and future weight gain avoided. Adopt a sensible management regime that ensures a horse has a suitable balanced diet with plenty of fibre and appropriate exercise.

Prevention is better than cure, and the aim of management should be to prevent weight gain at its first signs by adapting the management regime rather than having to take more dramatic action once an animal has reached an excessive weight.

A horse turned out permanently on good grazing with limited, active exercise is at equal risk of weight gain as a horse fed a high concentrate diet and confined for long periods. Weight needs to be kept in check throughout the year with all horses being managed by a combination of sensible rationing, a balanced high-fibre diet and regular exercise, appropriate to their needs and capabilities.

All horse keepers have a responsibility to keep animals in good health and at a healthy weight suited to the individual. By revising management and incorporating exercise with a fibre-based diet, access to suitable mixed herbage pasture and the company of other horses of a like condition and regime, horses can be kept happy, healthy and trim.

All About Pets

The national pet care information service

All About Pets provides expert advice, information and support for pet owners. It aims to ensure the welfare of Britain's pets by promoting responsible animal care. For further information and advice on caring for your pet or horse visit www.allaboutpets.org.uk. Alternatively, you can write to us at the address below to request a list of available leaflets.

All About Pets is a service of The Blue Cross, Britain's pet charity, which provides practical support, information and advice for pet and horse owners. Through our network of animal adoption centres we rehome thousands of animals each year. Our hospitals provide veterinary care for the pets of people who cannot afford private vets' fees.

How you can help

The Blue Cross is a registered charity and receives no government funding. We rely entirely on the generosity of pet lovers to help support All About Pets and other vital animal welfare projects. Any contribution would be most welcome. For more information on how you can help call us on 01993 822651 or visit our website at www.bluecross.org.uk.
